- Treating missing/null values.

Num-variable : Missing value - more than 30% missing - Drop column.

Num. var : missing " - less than 30% missing - replace with mean.

Num. var : missing " - less than 30% missing & outliers present - treat outliers and then replace with mean, also median (choose wisely).

Num. vari. : No missing value - Outliers present on the upper side (+1.5 IQR) - make outliers missing (NaN) and replace with upper bound or highest value in column.

Num. var : No missing value - Outliers present on -1.5 IQR - make it missing (NaN) and replace with lower bound or lowest value in column.

Cat. var : Missing value - More than 30% missing - Drop column.

Cat. var : missing " - less than 30% missing - replace with mode.

Cat. var : Missing " - less than 30% missing & logically replacing mode does not make senese - Drop the rows.

Cat · var : missing value	– less than 30% missing and logically replacing mode doesn't make sense, also dropping will harm other columns	– replace with new category called "not specified".
Cat · var : missing value	– less than 30% missing and logically replacing mode does not make sense also dropping rows will harm other columns but cannot create new category.	– Build prediction model using logistic regression or decision tree.
